RELEASE NOTES

IDEA Release 2026.4.5

Release 2026.4.5 brings more useful reporting, clearer crew records and a workspace that fits everyday onboard priorities. On board, IDEA YACHT lets you choose and arrange your own filters, gives Heads of Department a consolidated view of crew time and leave, and adds richer procedures and reports.

The mobile apps gain more practical field workflows and clearer synchronisation, and IDEA FLEET gives shore-side teams a clearer home for recurring reports, vessel manuals and ISM forms, with stronger sign-in. These notes summarise the changes by product.

IN THIS RELEASE

- **IDEA YACHT** — personal filters, crew time and leave, procedures, maintenance and inventory, purchasing reports
- **IDEA YACHT Mobile** — maintenance postponement, Shore Leave, stock work, snags and rounds
- **IDEA ASSET Mobile** — asset types offline and configured reading ranges
- **IDEA FLEET** — report subscriptions, maintenance reporting, manuals, ISM forms and multi-factor sign-in
- **Quality and reliability** — corrections grouped by business impact

SECTION 1

IDEA YACHT

Filters that fit each user

You can choose which filters to display, hide those you do not need and arrange the rest in your preferred order. Saved preferences reduce repeated setup. This customisation extends to maintenance, purchasing and the Snag List overview and map.

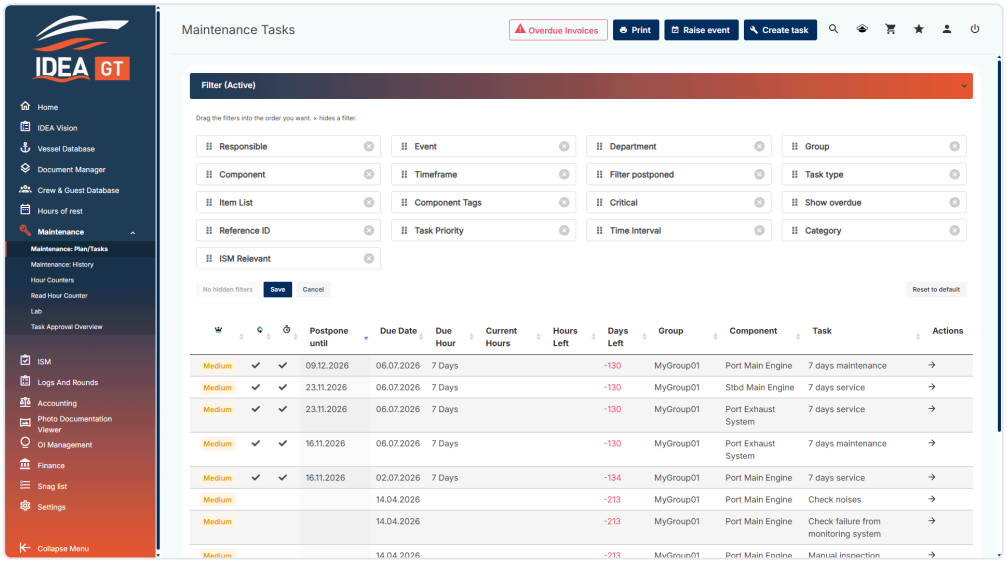

FIG. 1 — MAINTENANCE › PLAN/TASKS › CUSTOMIZE FILTERS: DRAG FILTERS INTO ORDER, × HIDES A FILTER.

Clearer crew time and leave records

A monthly team view gives Heads of Department a consolidated picture of actual work hours, watch days and comments. Shore Leave joins Holiday and Sick Leave in a single selection on web and mobile. You can also clear incorrectly added work time for a selected period.

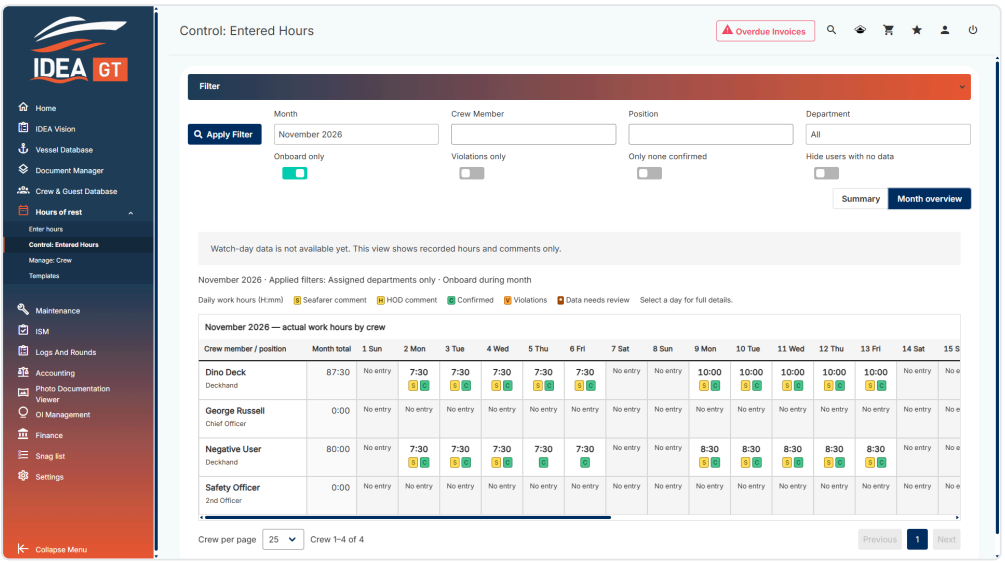

FIG. 2 — HOURS OF REST › CONTROL: ENTERED HOURS › MONTH OVERVIEW: DAILY WORK HOURS, COMMENTS AND CONFIRMATIONS BY CREW MEMBER.

Procedures with richer instructions

The modernised Standard Operating Procedures workspace supports multiple images per step, image remarks and highlights, and links to tasks, snags, rounds and forms. Updated reports handle richer content and let you choose how many steps appear on each page.

Better maintenance and inventory visibility

Maintenance history records task due dates, helping teams compare planned and actual completion. Spectro Jet-Care laboratory results use alert colours in the Lab list and widget. Inventory reports can focus on critical items and show quantities already on order. A storage tree makes master-location selection easier, and a direct barcode-print action reduces navigation.

Reports that support purchasing decisions

Finance transaction reports present totals in the relevant currencies and improve category summaries. Purchase-order overview reports can optionally include attachments and Direct Order process information. Technical component reports gain a Shipyard ID filter, and a dedicated report covers ISM-relevant components.

SECTION 2

IDEA YACHT Mobile

Maintenance postponement with a clear return date

Periodic and one-time tasks can be postponed until a selected date or for a predefined duration. The reason and planned reactivation date remain visible, and synchronisation preserves postponement details between the app and IDEA YACHT. Date and conflict handling protect newer updates from older offline changes.

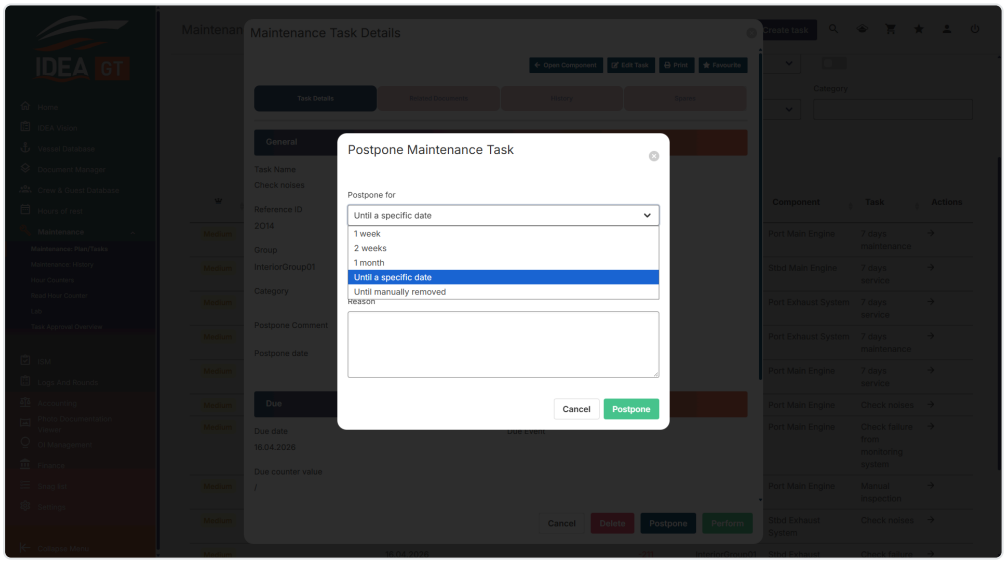

FIG. 3 — MAINTENANCE › PLAN/TASKS › POSTPONE MAINTENANCE TASK: CHOOSE THE PERIOD OR DATE AND RECORD A REASON.

Shore Leave from the app

You can record Shore Leave in **Enter Hours** alongside Holiday and Sick Leave. Matching options across web and mobile help teams keep leave records consistent, without changing how existing entries are handled.

Simpler stock work and spare-part creation

The spare-part wizard allows direct creation once the required information is complete. Check-in and check-out scanning handles unknown barcodes more usefully, and corrections remove false not-found messages for existing items. Exact NFC barcode matching prevents similarly prefixed codes from returning extra results. Storage quantities can be updated from the item detail screen.

Snag information that is easier to reach

Snag List Cloud supports configured custom fields. Mobile filters support searching domain and subdomain names when selecting components, and corrections address snag-name searches and detail screens that opened the wrong content.

Clearer expectations when postponing rounds

A warning explains that a round postponed in the app is not synchronised and cannot then be completed in the browser. This helps crew choose the right workflow before leaving a round unfinished.

SECTION 3

IDEA ASSET Mobile

Consistent classifications offline

For IDEA ASSET deployments, asset types assigned on the web are synchronised to the app and remain available offline. The app also gains local storage and evaluation of configured hour-counter and entry-point ranges, supporting consistent data handling in the field.

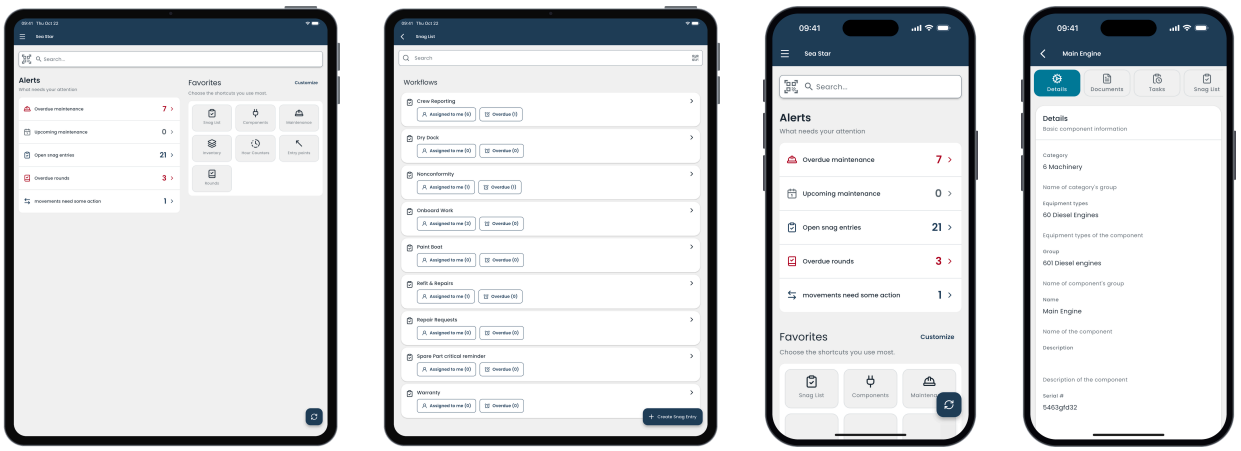

FIG. 4 — IDEA ASSET APP ON IPAD AND IPHONE: DASHBOARD, SNAG LIST WORKFLOWS AND COMPONENT DETAILS.

SECTION 4

IDEA FLEET

A clearer home for recurring reports

Report subscriptions are managed separately from the reports they generate. The redesigned overview groups generated reports under their subscription, with controls to edit, stop and resume recurring delivery. Existing subscriptions move into the new structure, making report history easier to follow.

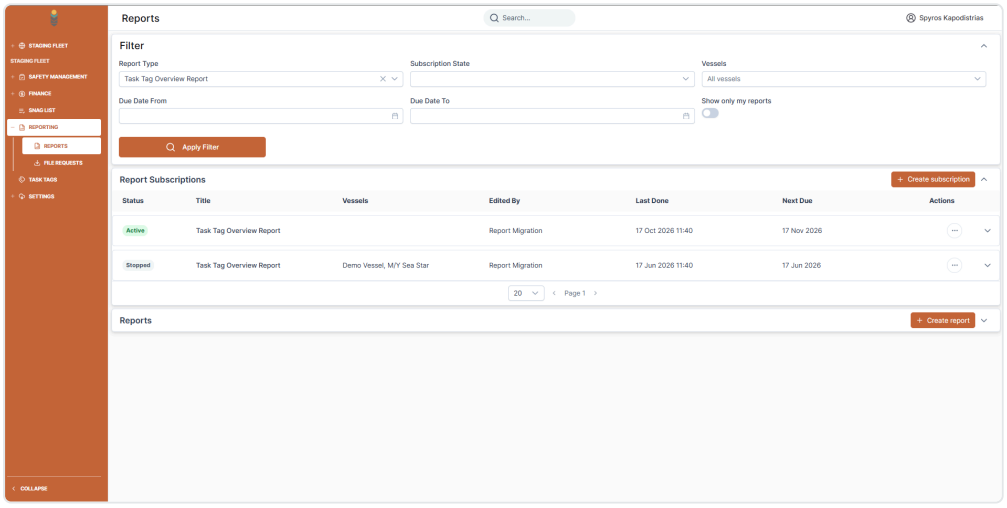

FIG. 5 — REPORTING › REPORTS: REPORT SUBSCRIPTIONS WITH STATUS, LAST DONE AND NEXT DUE.

Create, review and reuse report setups

A dedicated creation page supports one-time requests and subscriptions, with vessel selection, recipients, reporting periods and schedules. You can review report details and clone a setup instead of starting again.

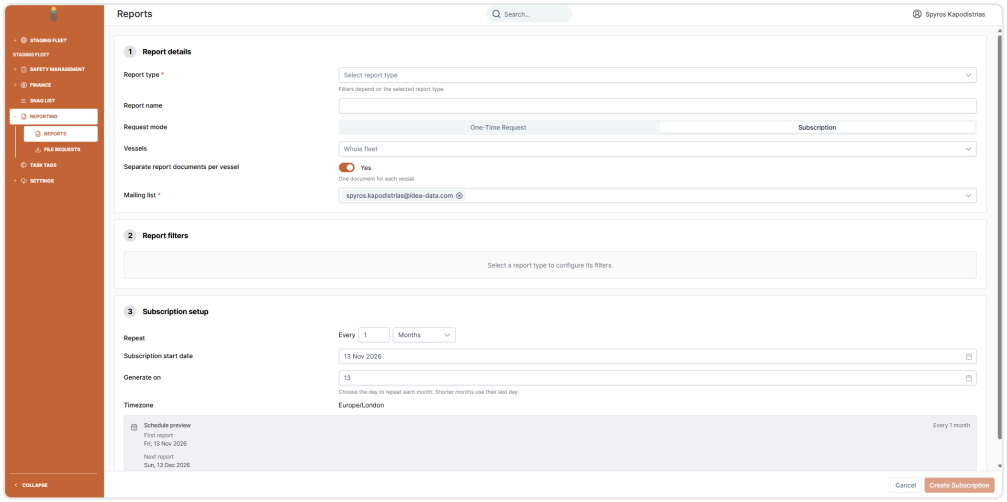

FIG. 6 — REPORTING › REPORTS › CREATE SUBSCRIPTION: REPORT DETAILS, FILTERS AND SUBSCRIPTION SETUP WITH A SCHEDULE PREVIEW.

Maintenance reporting for management

A Maintenance Overview Report brings together tasks, performance history and hour counters, with vessel, criticality and date-range filters. Task due dates in maintenance history add context for reviewing completion timing, and immediate history reports now include unplanned work.

Vessel manuals in one workspace

A new manuals overview supports fleet-wide and vessel-specific views, with filters for title, category, type and file. Teams can maintain manual details and attachments, download files and review change history. Shared categories and manual types help organise information across vessels.

Central control of ISM forms

IDEA FLEET supports creating and revising ISM forms, assigning them to vessels and reviewing completed or in-progress submissions. Central template management and revision handling help crews use the intended forms, while shore-side teams keep an overview of submissions.

Stronger sign-in and clearer vessel context

Multi-factor authentication adds device pairing, authentication prompts and recovery and reset options for users and administrators. Vessel cards show the installed IDEA YACHT version, and sidebar integration and transaction synchronisation support a more consistent working environment.

SECTION 5

Quality and reliability

Financial accuracy and purchasing records

Finance reports respect selected categories, combine duplicate category summaries and handle multi-currency totals more clearly. Purchase and work-order changes on the Details and Addresses tabs are saved correctly. Fleet transaction saving is corrected, currencies are protected for transfers between accounts, and Centtrip transaction currencies are displayed. Purchase-order approval safeguards prevent steps being bypassed.

Maintenance continuity and attachment recovery

Task editing handles installations without Stock Control by hiding unavailable order-link sections. Work orders linked to maintenance can be completed when Task Approval is active. A targeted repair restores valid attachment records incorrectly removed by duplicate clean-up, and one-time task tags transfer correctly between IDEA YACHT and IDEA FLEET.

Crew records and report completeness

The IMO monthly rest report no longer assigns template work hours to days off with no work entered. Calendar and violation views, and sign-in, are corrected for affected user accounts. Report generation handles large vessel structures, and immediate maintenance-history reports include unplanned history.

Mobile stock and snag workflows

Barcode and NFC lookup corrections reduce incorrect results during inventory work. Storage quantity updates are restored, snag searches return the intended records, and snag detail screens open the correct content.

Access protection and administration

File and maintenance-document download safeguards are strengthened, together with protections for affected data queries. Finance permissions are configurable, and maintenance delete controls respect your permissions. Position management handles dependencies in unavailable modules more clearly, and IDEA YACHT login supports configured multi-factor set-up and challenge flows.
